Ornamental Trees
Palms and
Evergreens

1903-1904

CALIFORNIA NURSERY CO.

NILES, CALIFORNIA

The following list of stock offered herewith includes only such as we have a limited quantity of, and is not enumerated in our general Catalogue and Price List No. 3.

All the ornamental trees have been several times transplanted, pruned and shaped to well-formed heads.

All Palms, Dracaenas and Evergreens that have been grown in boxes from one to three years, are almost absolutely safe from any loss after planting, and will grow at once. The larger sizes will produce an immediate effect.

Deciduous Ornamental Trees

To save freight, unless otherwise directed, all trees over sixteen feet tall will have tops cut back to a uniform height of sixteen feet.

PLANTING

The proper time to plant deciduous trees in our climate is after all heavy frosts have subsided and sufficient rain fallen to wet the ground. With Evergreens and Semi-Tropical Plants it is best to plant from February to April, before they start a new growth. Palms do best if planted late in spring, from March to June.

The ground should be thoroughly ploughed or spaded deep, and holes dug from eight inches to one foot larger in every direction than required by the roots when spread out in their natural position. It is very important in heavy soil to make deep holes and then fill in again, thus insuring drainage. In shallow holes after a heavy rain, the roots will stand in water and tree die. Evergreens lifted with balls should be planted with the burlap remaining on the roots. This should not be removed. Trees planted in light soil may stand from two to three inches deeper than they stood in the Nursery. This is especially true of Evergreens of large size.

In heavy and wet ground it is advisable to plant as the trees stood in the Nursery. With all large trees the soil should be filled in gradually and well tamped, so as to make it very firm. A rammer can be used when roots are well covered. When all is filled in put two inches of loose soil on top.

PRUNING AT TIME OF PLANTING

Ornamental Trees should be pruned in proportion to amount of roots lost in transplanting. The natural shape should be preserved and the lower limbs shortened and not cut off, so that the new growth will shade the tree. They can be cut off in after years, when the top is fully developed, so as to give the necessary shade.

Evergreens can be pruned by thinning out the foliage and shortening in the limbs.

All Ornamental Trees require only such pruning after being established as will prevent a straggling growth of the head, and bring the head up to the desired height. This should be done gradually from time to time, until the tree is strong enough to resist the wind.

STAKING AND SHADING

Many trees may be seen along sidewalks and roadsides crooked and bent. A stake of sufficient size set at time of planting, and the tree firmly tied to it until of sufficient size to resist the sway of the wind, will insure a straight growth.

Evergreens of large size should be staked so that the wind will not pull them loose during a long rain or storm. On dry ground, or where there are no facilities to water, trees should be shaded on the southwest with a board or a piece of burlap, wound loosely around the body of the tree up to its limbs.

AFTER-CULTURE

The success of the newly planted trees depends entirely upon the care and cultivation they receive the first three months after planting. All Evergreens should be kept watered until they make a new growth. The ground should be kept loose by cultivation for at least three feet around the tree. If the ground is not under cultivation, the surrounding dry soil will absorb all the water given the tree. A mulch can be put around the tree to keep the soil from baking.
